This App is used for children learning about the frog's life cycle in Science, for grade 3. This App would best be suitable for children in a small group or at centers. Children can click on vocabulary words and the teacher can scaffold steps about learning the different terms in the frog's life cycle. Children can also use this App during centers, where the children navigate through the App. After centers time, the teacher can lecture and have a group discussion about what they have learned using the App. This can be used for teaching such as an assessment. For example, the teacher can provide a group discussion after centers time, or children can work in groups and make a diagram about the stages in a frog's life cycle and then present what they came up with. A feature I like about the App is the video feature which allows children to click and view the life cycle of a frog. A feature through this App that is not a necessity for third graders is the links that is provided where they can click and learn more about the frog's life cycle through the different websites provided. According to Ashish Thirani, (2014), the App is "excellent".
